# Rotating Magnetic Field

- Given a set of ac currents shifted in time
- Apply these currents to shifted in space stator windings

Produce MMF vector  $\mathbf{F}_s$  that

- Has constant magnitude
- Rotates in space

$$\theta_e = \omega_e t$$

$$i_{as} = I_m \cos(\omega_e t)$$

How many phases can you have ?

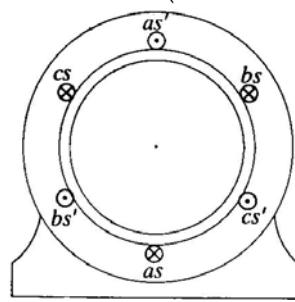

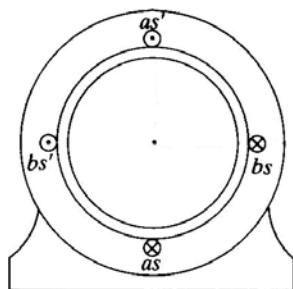

$$i_{as} = I_m \cos(\omega_e t)$$

$$i_{bs} = I_m \cos(\omega_e t - 90^\circ)$$

$$i_{bs} = I_m \cos(\omega_e t - 120^\circ)$$

$$i_{cs} = I_m \cos(\omega_e t + 120^\circ)$$

2,3,5,6 - -

$$\mathbf{F}_s = F_m \angle \theta_e$$

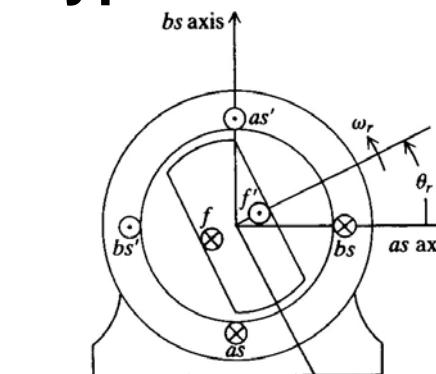

$$\mathbf{F}_s = (3/2) F_m \angle \theta_e$$

How do you change direction of rotation ?

## Excitation – Establishing Rotor Field

In order to establish the rotor field we need to pass DC current through the field winding

Use **Slip-Rings & Brushes** to energize the field winding from external DC source

Claw-Pole Rotor - typically used in automotive alternators

# Permanent Magnets (PM) Rotor Types

Use Permanent Magnets (PM) to establish the rotor field

Surface-Mounted PM Rotors

Use Permanent Magnets (PM) to establish the rotor field

Radial Buried Magnets

Circumferential Buried Magnets

# P-Pole Rotating Magnetic Field

$$\theta_e = \omega_e t$$

Electrical displacement

$$\theta_e = 0 \rightarrow 2\pi$$

One cycle of currents =  $2/P$  revolution of magnetic poles

$$\omega_{syn} = \frac{2}{P} \omega_e$$

Synchronous speed is the speed of rotation of magnetic poles. This speed is  $2/P$  of the electrical speed

$$n_{syn} = \frac{30}{\pi} \omega_{syn} = \frac{120}{P} \cdot f_e \text{ [rpm]}$$

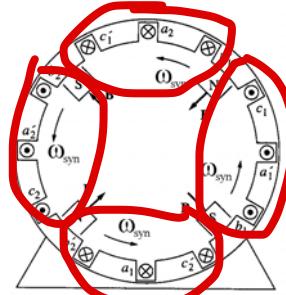

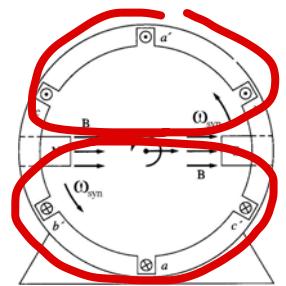

What are the rotor mechanical speed & position ?

$$\omega_{rm} = \frac{2 \omega_e}{P} = \frac{2}{P} \omega_r$$

$$\theta_{rm} = \frac{2}{P} \theta_r$$

$$\begin{cases} \omega_r \\ \theta_r \end{cases}$$

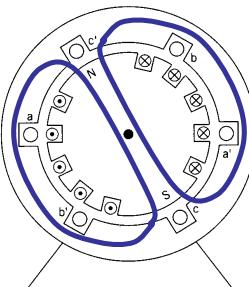

are referred to an equivalent 2-pole machine

# Poles & Speed in Syn. Machines

2-Pole Round Rotor

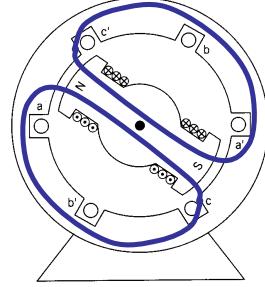

For North America  
 $f_e = 60 \text{ Hz}$

$$\omega_e = 2\pi \cdot f_e \text{ [rad/s]}$$

Synchronous Speed  
in rev. per min.

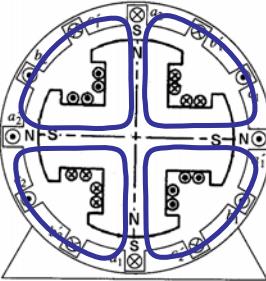

2-Pole Salient Rotor

For balanced three phase system

$$\left. \begin{aligned} i_{as}(t) &= \sqrt{2} \cdot I_{rms} \cos(\omega_e t) \\ i_{bs}(t) &= \sqrt{2} \cdot I_{rms} \cos(\omega_e t - 120^\circ) \\ i_{cs}(t) &= \sqrt{2} \cdot I_{rms} \cos(\omega_e t + 120^\circ) \end{aligned} \right\}$$

4-Pole Salient Rotor

$$n_{syn} = \frac{30}{\pi} \omega_{syn} = 60 \frac{2}{P} \cdot f_e \text{ [rpm]}$$

$$\text{Electromagnetic torque } T_e \approx \frac{P}{2} \frac{\partial}{\partial \theta_r} \left( \frac{1}{2} \mathbf{i}^T \mathbf{L}(\theta_r) \mathbf{i} \right)$$

$\frac{P}{2}$  - is similar to gearbox ratio

P pole	n <sub>syn</sub>	$\omega_{syn}$
2	3600	$120\pi$
4	1800	$60\pi$
6	1200	$40\pi$
8	900	$30\pi$
10	??	??
64	112.5	$3.75\pi$

## Generation & Utilization of Electricity

- Use low number of poles (e.g. 2, 4, 8, etc) for high-speed (e.g. 3600 – 900 rpm) low torque applications
  - Steam & thermal turbine generators, high speed motors, etc.
- Use high number of poles (e.g. 64.. ) for low-speed (e.g. 112.5 rpm) high torque applications
  - Hydro generators, direct-drive wind generators, low speed motors, etc.

11

## Principle of Operation – Idle Mode

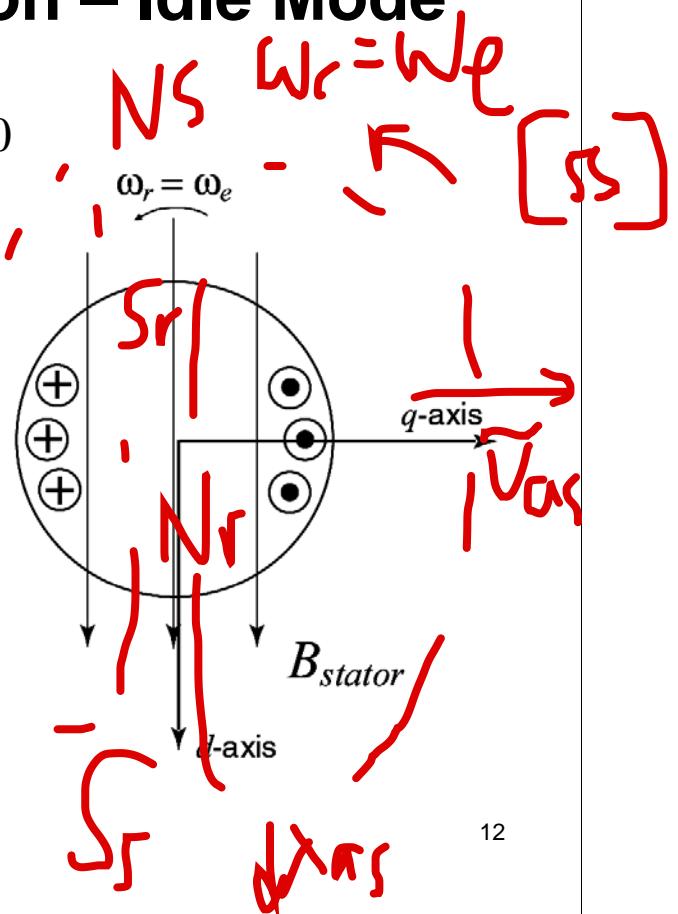

a) Assume no external torque  $T_m = 0$ 

- Rotor poles are synchronized with the stator field
- Rotor poles are aligned with stator poles
- No torque produced  $T_e = 0$

$$V_{as} = \frac{d\lambda}{dt} = \sum V_s \cos(\omega t)$$

$$\lambda_{as} = \frac{1}{w_e} \sum V_s \sin(\omega t)$$

lag  $V_{as}$

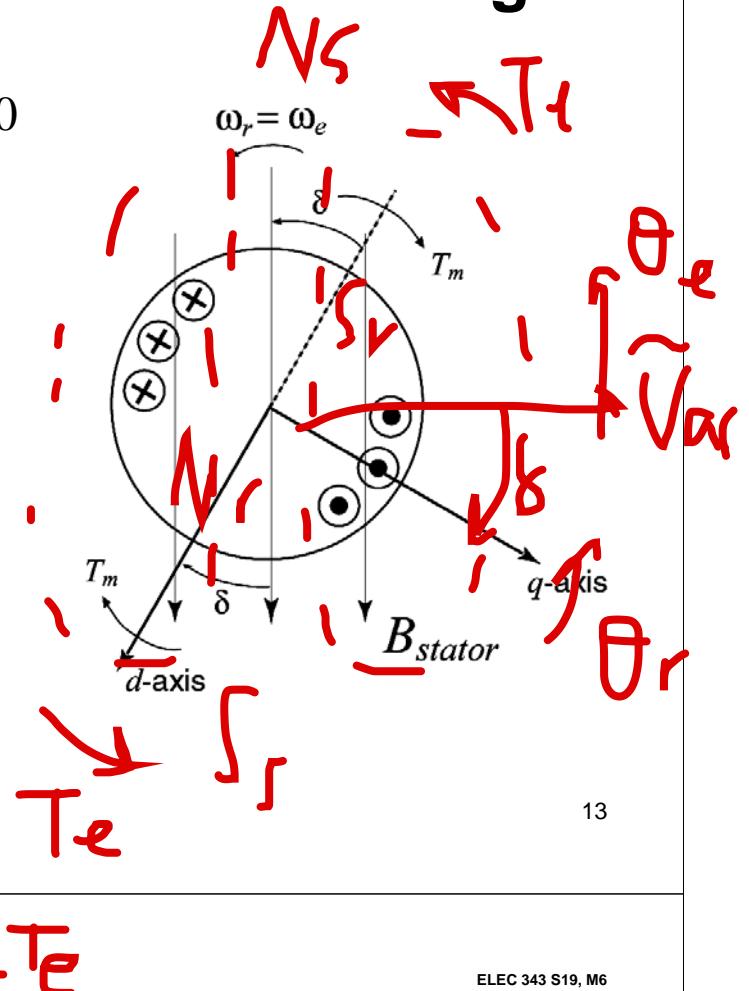

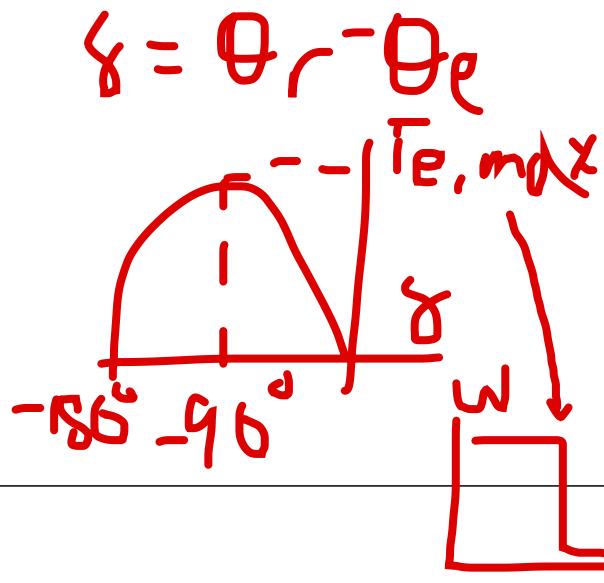

12

# Principle of Operation - Motoring

c) Apply external torque  $T_m < 0$   
in the direction opposite to rotation

- Rotor poles are synchronized with the stator field
- Rotor poles **lag** stator poles
- Torque is produced  $T_e$

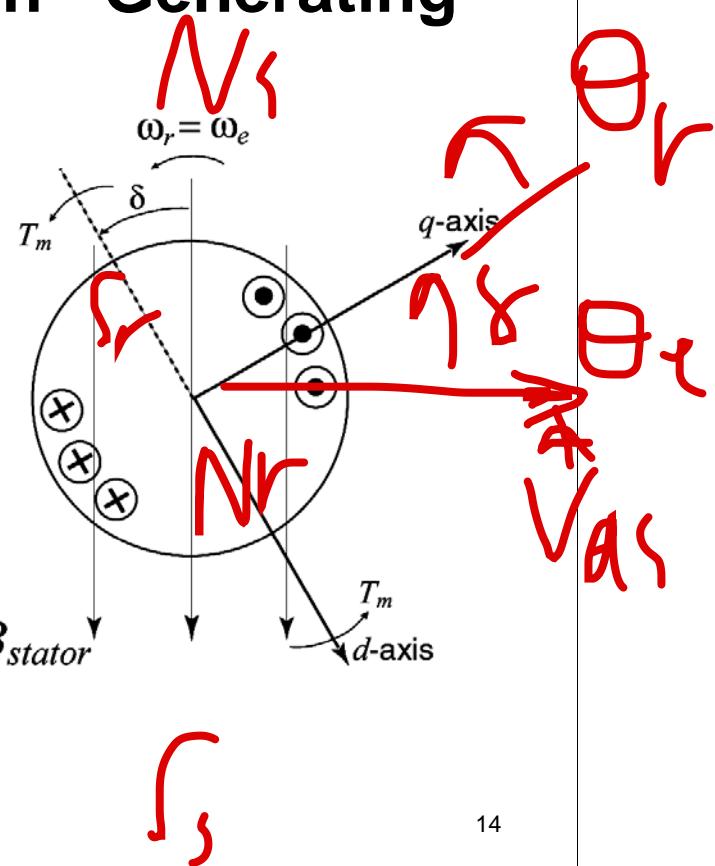

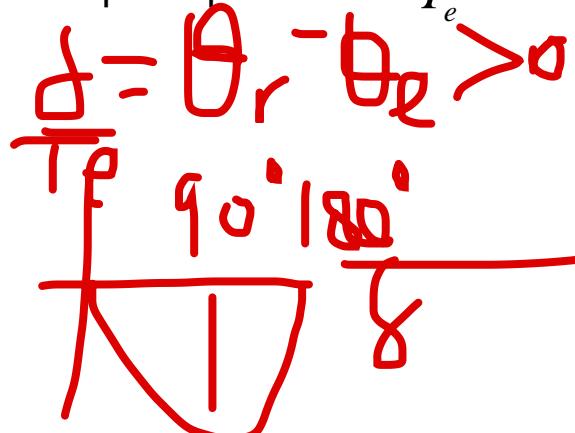

13

# Principle of Operation - Generating

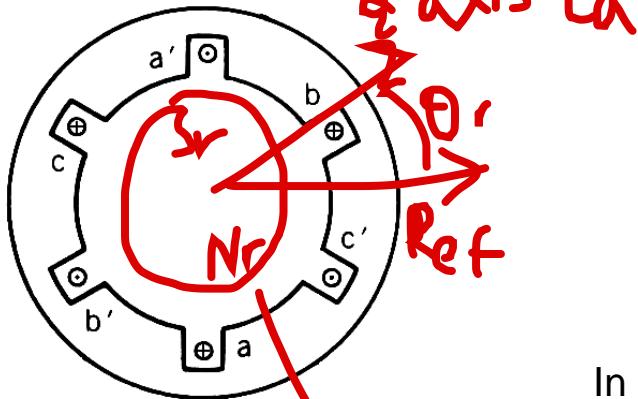

b) Apply external torque  $T_m > 0$   
in the direction of rotation

- Rotor poles are synchronized with the stator field
- Rotor poles **lead** stator poles
- Torque is produced  $T_e$

2. Bring the Syn. Machine speed corresponding to the desired frequency (60Hz)  $\Rightarrow f_{sm} \sim f_s$
3. Adjust the magnitudes (either by field current or by source voltage) such that  $\Rightarrow E_{sm} \sim V_s$
4. Adjust/make sure the phase difference is zero
5. Close the connecting switch

# Flux Linkages & Inductances

Recall

$$L_{md} = \frac{N_s^2}{\mathfrak{R}_{md}}$$

$$L_{mfd} = \frac{N_{fd}^2}{\mathfrak{R}_{md}} = \left( \frac{N_{fd}}{N_s} \right)^2 L_{md}$$

Use  $\left( \frac{N_s}{N_{fd}} \right)^2$  and  $\frac{N_s}{N_{fd}}$   
to refer rotor variables to  
the stator side

$$L_{sfd} = \frac{N_s N_{fd}}{\mathfrak{R}_{md}} = \frac{N_{fd}}{N_s} L_{md}$$

Result

$$L'_{mfd} = L_{mfd} \left( \frac{N_s}{N_{fd}} \right)^2 = L_{md} \quad L'_{sfd} = L_{sfd} \frac{N_s}{N_{fd}} = L_{md} \quad L'_{lfd} = L_{lfd} \left( \frac{N_s}{N_{fd}} \right)^2$$

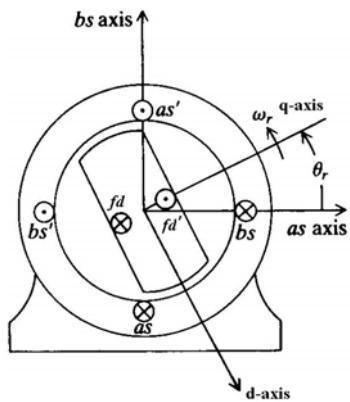

$$L'_{fd} = L'_{lfd} + L_{md}$$

$$r'_{fd} = r_{fd} \left( \frac{N_s}{N_{fd}} \right)^2 \quad i'_{fd} = i_{fd} \frac{N_{fd}}{N_s} \quad v'_{fd} = v_{fd} \frac{N_s}{N_{fd}} \quad \lambda'_{fd} = \lambda_{fd} \frac{N_s}{N_{fd}}$$

$$(\mathbf{K}_s^r)^{-1} \mathbf{v}_{qds} = \mathbf{r}_s (\mathbf{K}_s^r)^{-1} \mathbf{i}_{qds} + \frac{d}{dt} \left[ (\mathbf{K}_s^r)^{-1} \lambda_{qds} \right]$$

$$v'_{fd} = r'_{fd} i'_{fd} + \frac{d\lambda'_{fd}}{dt}$$

# Flux Linkage Equations in RRF

Original equation

$$\begin{bmatrix} \lambda_{abs} \\ \lambda'_{fd} \end{bmatrix} = \begin{bmatrix} \mathbf{L}_s & \mathbf{L}'_{sr} \\ \mathbf{L}_{sr}^T & L'_{fd} \end{bmatrix} \cdot \begin{bmatrix} \mathbf{i}_{abs} \\ i'_{fd} \end{bmatrix}$$

One of the major advantages of  $qd$ -reference frame that we get =>

$$\mathbf{K}_s^r \mathbf{L}_s (\mathbf{K}_s^r)^{-1} = \begin{bmatrix} L_{ls} + L_{mq} & 0 \\ 0 & L_{ls} + L_{md} \end{bmatrix} \quad \mathbf{L}_{sr}^T (\mathbf{K}_s^r)^{-1} = \begin{bmatrix} 0 & L_{md} \end{bmatrix}$$

$$\mathbf{K}_s^r \mathbf{L}'_{sr} = \begin{bmatrix} 0 \\ L_{md} \end{bmatrix}$$

Resulted flux linkage equation

$$\begin{bmatrix} \lambda_{qs} \\ \lambda_{ds} \\ \lambda'_{fd} \end{bmatrix} = \begin{bmatrix} L_{ls} + L_{mq} & 0 & 0 \\ 0 & L_{ls} + L_{md} & L_{md} \\ 0 & L_{md} & L'_{fd} + L_{md} \end{bmatrix} \cdot \begin{bmatrix} i_{qs} \\ i_{ds} \\ i'_{fd} \end{bmatrix}$$

Note: The inductance matrix is constant, and  $q$  and  $d$  axes became magnetically decoupled !

$$v'_{fd} = r'_{fd} i'_{fd} - \frac{d\lambda'_{fd}}{dt}$$

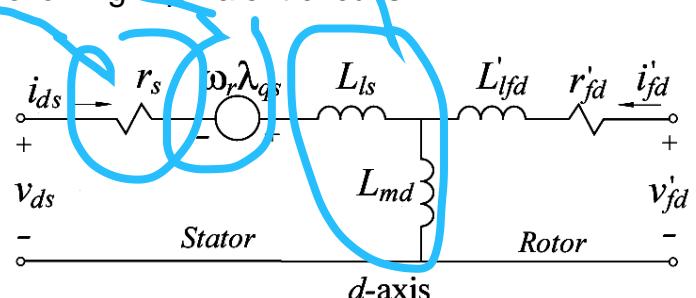

Expanded Flux Linkage Equations

$$\lambda_{qs} = L_{ls} i_{qs} + L_{mq} i_{ds} = L_q i_{qs}$$

$$\lambda_{ds} = L_{ls} i_{ds} + L_{md} i_{ds} + L_{md} i'_{fd} = L_d i_{ds} + L_{md} i'_{fd}$$

$$\lambda'_{fd} = L'_{fd} i'_{fd} + L_{md} i'_{fd} + L_{md} i_{dc} = L'_{fd} i'_{fd} + L_{md} i_{ds}$$
